FIG. 5: A 31-year-old man who sustained a penetrating injury when he stepped on a sharp piece of bamboo.
A: Arteriogram of left foot shows enlarged tortuous posterior tibial artery with single-hole fistula (white arrow) and early filling of a draining vein.
B: A microcatheter, advanced into distal posterior tibial artery, better demonstrates the arteriovenous fistula (solid arrow).
C: Plain radiograph shows platinum microcoils advanced into the draining vein.
D: Final angiogram through microcatheter after coil embolization shows occlusion of fistula with preservation of normal arteries.
